Abstract

Aim: The present study was aimed to synthesize a series of 2-substituted benzylidine imino-3-(3-chloro-4-fluorophenyl)-carboxamido-4,5-trimethylene thiophenes SPJ-1(a-m) and to evaluate their in-vitro anti-inflammatory activity.

Materials and Methods: The starting material (SPJ-1) was prepared by the application of versatile Gewald reaction [6, 7]. Treatment of starting material with various substituted aromatic aldehydes gave the title compounds SPJ-1(a-m) and evaluated using inhibition of bovine serum albumin denaturation method.

Result: SPJ-1b and SPJ-1g have shown significant in-vitro anti-inflammatory activity.

Conclusion: The findings of the present study clearly demonstrate that chloro functional group possess inhibition of bovine serum albumin denaturation capacity and has in-vitro anti-inflammatory activity. However hydroxyl, nitro, methyl, methoxy and dimethyl amino derivatives did not show any in-vitro anti-inflammatory activity.

Introduction

Thiophene containing organic compounds forms a significant group of drugs which exhibit an array of biological activities ranging from anti-inflammatory [1-5], antibacterial, antifungal, local anaesthetic, analgesic, anti-neoplastic, antiarthritic, antitussive and so on.

The starting material 2-amino-3-(3-chloro-4-fluorophenyl carboxamido)-4,5-trimethylene thiophene (SPJ-1) was prepared by the application of the versatile Gewald reaction [6, 7]. Treatment of starting material with various substituted aromatic aldehydes gave the title compounds SPJ-1(a-m).

All the synthesized compounds were characterized by their physical and spectral data. The IR spectra of compound SPJ-1 showed an intense sharp NH₂ absorption peak at 3413.29 cm⁻¹; C-S peak at 778.75 cm⁻¹. The formation of Schiff’s bases SPJ-1(a-m) was confirmed by the presence of an imine (HC=N).
peak at 1659.74 - 1643.67 cm⁻¹ and the absence of NH₂ peak which was present in the IR spectra of SPJ-1. The 'H NMR spectra of compound SPJ-1a, SPJ-1e, SPJ-1i exhibited all the expected protons. Mass spectra of compound SPJ-1-d exhibited M⁺ ion peak at 428 (16.94%) indicating that this molecule is rather unstable at 70eV and undergo fragmentation to form daughter ions. Appearance of M⁺ ion and their characteristic daughter ions confirm the structure proposed for the compounds.

Materials and Methods

Drugs and Chemicals

Ethylcyanoacetate (Sisco Research Laboratories Pvt. Ltd., India), Cyclopentanone (Sisco Research Laboratories Pvt. Ltd., India), Sulphur (SD Fine Chem, India), Bovine serum albumin (Merck Limited). The Standard Ibuprofen, solvents and other chemical used for the study were of analytical grade and purchased from local firms.

Experimental design

Experimental design is been given in Figure 1 and Figure 2.

Figure 1: Synthesis of 2-amino-3-(3-chloro-4-fluorophenyl) carboxamido-4,5-trimethylene thiophene (SPJ-1).

Figure 2: Syntheses of 2-substituted benzylidene imino-3-(3-chloro-4-fluorophenyl) carboxamido-4,5-trimethylene thiophenes. SPJ-1(a-m).

Step 1- Synthesis of 3-Chloro-4-fluoro cyanoacetanilide (SPJ). A mixture of 3-chloro-4-fluoro aniline (0.5M, 36.35 gm) and Ethyl cyanoacetate (0.5 M, 26.60 ml) was heated at 160°-170°C for 6 hours. The reaction mixture was left at room temperature overnight. The solid obtained was washed with ethanol, dried and then recrystallized from acetone water mixture (5:1 ratio). Yield: 55.70 %. M.P. 172 °C.

Step 2- Synthesis of 2-amino-3-(3-chloro-4-fluorophenyl) carboxamido-4,5-trimethylene thiophene (SPJ-1). A mixture of 3-Chloro-4-fluoro cyanoacetanilide SPJ (8.48 gm, 0.04 M), cyclopentanone (3.45 ml, 0.04 M), ammonium acetate (2 gm) and glacial acetic acid (2 ml) in benzene (150 ml) was refluxed for 8 hrs using Dean stark apparatus with an arrangement for continuous separation of water. After 8 hrs, the reaction mixture was cooled, diluted with 20 ml of benzene and washed 3 times with sodium carbonate solution (10 % w/v in water) and water successively. The solvent was removed under vacuum and the intermediate crude product 2-Cyano-2-(cyclopentylidene)-m-chloro-pfluoro carboxanilide obtained was immediately processed for the next step.

A mixture of 2-Cyano-2-(cyclopentylidene)-3-chloro-4-fluorocarboxanilide, Sulphur (1.28 gm, 0.04 Mol) and ethanol (30 ml) was taken in conical flask. The above mixture was stirred at 45-50°C. Once the
temperature was attained, Diethyl amine (4 ml) was added drop wise until Sulphur completely went in. The solid obtained was filtered, washed with ethanol and recrystallized from benzene. Yield: 95.75 %. M.P.: 122 °C; IR (KBr): 3413.29 (-NH2); 3329.98 (-NH str); 3079.82 (Ar-CH str); 2918.98 (Ali-CH); 1633.73 (-NH bend); 1658.33 (C=O); 1508.31 (Ar C=C); 1221.34 (C-F); 828.40 (C-N); 778.75 (C-S); 688.31 (C-Cl).

Step 3- General method for the syntheses of 2-substituted benzylidene imino-3-(3-chloro-4-fluorophenyl) carboxamido-4,5-trimethylene thiophenes. SPJ-1(a-m). A mixture of the starting compound (SPJ-1) (0.005 Mol) and the required aryl aldehydes (a-m) (0.005 Mol) in isopropyl alcohol (10 ml) and catalytic amount of glacial acetic acid (2 ml) was subjected to Microwave irradiation [8]; at 750W for 2-4 minutes. Then cooled to room temperature. The solid separated was filtered, washed with isopropyl alcohol and recrystallized with DMF: Ethanol (6:1 ratio).

In-vitro Anti-inflammatory activity
The synthesized compounds were screened for in-vitro anti-inflammatory activity by inhibition of bovine serum albumin denaturation method according to M.N.A. Rao et al [9].

Experimental design
The test compounds were dissolved in minimum amount of dimethyl formamide (DMF) and diluted with phosphate buffer (0.2 M, pH 7.4). Final concentration of DMF in all solution was less than 2.5%. Test solution (1 ml) containing different concentrations of drug was mixed with 1 ml of 1mM albumin solution in phosphate buffer and incubated at 27º ±1ºC for 15 min. Denaturation was induced by keeping the reaction mixture at 60º ± 1ºC in a water bath for 10 min. After cooling the turbidity was measured at 660 nm (Shimadzu Spectrometer). Percentage inhibition of denaturation was calculated from control where no drug was added. Each experiment was done in triplicate and the average was taken. The percentage of inhibition is calculated from the following formula.

% Inhibition = 100 (1 - Vt/Vc)

Where, Vt = Drug absorbance of triplicate average, Vc = Control absorbance of triplicate average.

Results
Physical data
Melting points were determined in open capillaries and are uncorrected. Purity of the compounds was checked by TLC on silica gel plates. The solvent system used to carry out the TLC is Benzene : Chloroform at a ratio of 7:3.

Spectral data
IR spectra (cm⁻¹) were recorded in KBr on a Shimadzu FTIR-8700 spectrometer. NMR (ppm) [NMR (CDCl3) δ (ppm)] in CDCl3 using TMS as reference on Bruker 400 AMX. Mass spectra of the compound coded SPJ-1-d was carried out.

Compound SPJ-1-a: 11.45 (s, 1H, NH); 8.28 (s, 1H, N=CH); 2.85 (s, 6H, CH3); 3.20 (t, 2H, CH2, cyclopentane); 2.15 (m, 2H, CH2, cyclopentane); 2.55 (t, 2H, CH2, cyclopentane); 7.50 (d, 1H, Ar-CH); 7.12 (d, 1H, Ar-CH); 7.98 (d, 1H, Ar-CH); 7.72 (d, 1H, Ar-CH); 6.75 (d, 1H, Ar-CH); 6.75 (d, 1H, Ar-CH).

Compound SPJ-1-e: 11.19 (s, 1H, NH); 8.43 (s, 1H, N=CH); 2.46 (s, 3H, CH3); 3.13 (t, 2H, CH2, cyclopentane); 2.42 (m, 2H, CH2, cyclopentane); 2.90 (t, 2H, CH2, cyclopentane); 7.50 (d, 1H, Ar-CH); 7.12 (d, 1H, Ar-CH); 7.94 (d, 1H, Ar-CH); 7.76 (d, 1H, Ar-CH); 7.38 (d, 1H, Ar-CH); 7.38 (d, 1H, Ar-CH).

Table 1: Physical data of compounds prepared.
Compound SPJ-1-i: 11.06 (s, 1H, NH); 8.40 (s, 1H, N=CH); 2.43 (m, 2H, CH₂, cyclopentane); 2.92 (t, 2H, CH₂, cyclopentane); 7.81 (d, 1H, CH); 7.45 (d, 1H, CH); 7.92 (d, 1H, CH); 7.12 (s, 1H, CH); 3.95 (s, 9H, OCH₃).

The presence of fluorine on a bioactive molecule enhances cell penetration and protein binding. Thus it was felt worthwhile to take up the present investigation to synthesize some novel thiophenes and test their effect on *in-vitro* anti-inflammatory activity.

Clinically established anti-inflammatory drugs have shown to inhibit heat coagulation of proteins. These anti-inflammatory drugs have exerted an inhibitory activity on immune haemolysis and also have suppressive effect on vascular reactivity. Denaturation as one of the causes of inflammation is well documented. Antiinflammatory drugs interact in some way with proteins. To cause the interaction between the drug and the proteins, the stability of proteins against heat coagulation can be measured.

### Discussion

The purpose of the present work was to synthesize a series of desired title compounds (SPJ-1-a-m) from 2-amino-3-(3-chloro-4-fluorophenyl) carboxamido-4, 5-trimethylene thiophene (SPJ-1) by reacting with various substituted aromatic aldehydes (a m). The syntheses were carried out in accordance with the literature as in the Figure 1 and 2.

As discussed earlier, thiophenes are a class of heterocyclic compounds that shows an array of biological activities which include anti-inflammatory, anti-bacterial, anti-fungal, anti-tubercular, anti-convulsant, anti-cancer, and local anesthetic activity.

### Conclusion

In conclusion, from the *in-vitro* anti-inflammatory activity results, it was observed that both electron donating
and electron withdrawing groups on the aldehydic phenyl ring of the compounds influenced the activity. But aldehydic phenyl ring containing electron withdrawing groups had shown more promising result. Among all the compounds tested, SPJ-1g with 2’-chloro substitution at R and SPJ-1b with 4’-chloro substitution at R showed good in-vitro anti-inflammatory activity. The remaining compounds exhibited mild to moderate activities compared to the standard Ibuprofen.
